Let Alice have the primes $p = 107$, $q = 127$ and the exponent $k = 5$.

Determine m and $\Phi(m)$ and show that $k = 5$ is a valid choice by computing $\gcd(k, \Phi(m))$.

from chapter 16.1 [1] it follows that $m = p \cdot q = 107 \cdot 127 = 13589$. Then, $\Phi(m) = (p - 1)(q - 1) = 106 \cdot 126 = 13356$.

Computing $\gcd(k, \Phi(m)) = \gcd(5, 13356)$, since k and $\Phi(m)$ needs to be coprime for k to be a valid choice.

This can be computed using the Euclidean algorithm 3.2 [1]: let $r_0 = 13356$, $r_1 = 5$, and compute the sequence of remainders:

$$\begin{aligned} 13356 &= q_1 \cdot 5 + 1 \quad \text{for } q_1 = 2671 \text{ and } r_2 = 1 \\ 5 &= q_2 \cdot 1 + 0 \quad \text{for } q_2 = 5 \text{ and } r_3 = 0 \end{aligned}$$

hence

$$\gcd(5, 13356) = r_2 = 1$$

since the greatest common divisor is 1, according to definition 3.1 [1] then $k = 5$ is coprime to $\Phi(m) = 13356$ and is a certified valid choice for a public key.

Determine Alice's private exponent u

A number u is a valid private exponent if it satisfies the equation $k \cdot u \equiv 1 \pmod{\Phi(m)}$.

To determine this, see definition 9.18 [1] to see how to determine such a number u .

Some prerequisites to use the method in definition 9.18 [1] is to know the value of $\Phi(m)$ for $m = p \cdot q$, $p \neq q$ where p and q are primes, and that k is coprime to $\Phi(m)$. All of these prerequisites are satisfied in the previous section.

The method uses the extended Euclidean algorithm 3.3 [1] to find bezout coefficients u and v such that $k \cdot u + \Phi(m) \cdot v = 1$.

Use the algorithm to find u : let $au + bv = \gcd(a, b)$, where $a = 5$ and $b = 13356$. the quotients $q_1 = 2671$ and $q_2 = 5$ are already computed in the previous section.
